My name is Anastasia, and I founded Rewiring Hope in Indonesia because I could no longer ignore a quiet ache that kept returning. For years, I watched students lose their sense of possibility. I saw anxiety settling into their bodies, and I saw motivation slowly fading from the faces of young people who once believed that learning was a place where they belonged. I kept asking myself a simple but haunting question. Where does a child's hope go when learning no longer feels safe, and what can neuroscience offer to help them find their way back?

Rewiring Hope was born from that question. It is a small initiative with a determined heart. Our work is built on the belief that neuroscience should not live only in journals or on conferences. It should live inside classrooms, inside families, and inside the everyday lives of young people who are trying to survive emotional and academic storms.

This July, with support from the 2026 IBRO and Dana Brain Awareness Week Grant, we will host two events that carry this mission forward. On 2 July, we will hold Kisah Otak yang Tangguh, a community celebration designed to help children and families experience resilience through stories, play, and simple brain-based activities that feel warm and accessible. On 4 July, we will host Teaching the Healing Brain, a gathering for teachers who are ready to imagine a classroom where neuroscience becomes a gentle structure for emotional recovery, curiosity, and renewed motivation. These events are not only programmes. They are small openings where science meets community and where students may feel seen and understood again.

If any part of this resonates with your work, especially if you are exploring neuroeducation, youth mental health, resilience, or community outreach, I would be grateful to connect. I believe movements grow stronger when women walk together with clarity and kindness.

You can learn more at www.rewiringhope.or.id or through instagram @rewiringhopeindonesia.

Thank you for welcoming me into this remarkable circle of women in neuroscience. I look forward to growing together.
